Let & Var Exercise

1. The difference between let and var is that you are not able to reassign with let and let creates a block scope. With var, you have the ability to reassign.
2. The main difference between var and const is that const creates a block scope. You can't reassign using const, but with var, you can.
3. The difference between let and const is that once you use const, you can not redeclare. You can if you are using let.
4. Hoistings is the way in which we explain JS compiler and how it works. It explains how functions, variables, and classes are moved to the top of their scope before we execute the code.
